

NON FUNCTIONAL REQUIREMENTS

NFR1: Performance

NFR1.1: Load and Concurrency

NFR1.1.1: The system should be able to handle and balance load without immediately crashing.

NFR1.1.2: The system should ensure that multiple candidates can access the platform simultaneously with minimal/no lag.

NFR1.2: Scalability

NFR1.2.1: The system should be able to scale in performance based on resource and user demand.

NFR2: Usability

NFR2.1: Error handling

NFR2.1.1: The system must handle user or system errors gracefully, indicating exactly what went wrong and what steps should be taken to fix the error.

NFR2.2: Accessibility

NFR2.2.1: The user interface must have accessibility features to allow the system to accommodate various disabilities.

NFR3: Security

NFR3.1: Access control

NFR3.1.1: The system must strictly enforce access levels. Candidates should only be able to see assessments assigned to them, and only recruiters have admin privileges.

NFR4: Reliability

NFR4.1: Recovery

NFR4.1.1: The system should demonstrate the ability to recover from crashes while preventing progress or data loss.

NFR4.2: MTTR

NFR4.2.2: There should be a tracked average time to restore the system if critical components fail

NFR5: Maintainability

NFR5.1: Modularity

NFR5.1.1: The system should be designed in a modular manner, ensuring low coupling and that components are independent and interchangeable.

NFR5.2: Code quality

NFR5.2.1: The code should be written in industry standard quality, including linting, separation of concerns and adherence to software engineering principles, allowing it to be easily maintained.
